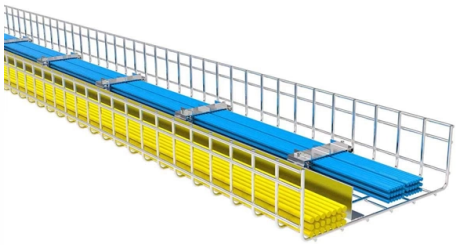
ZITHA TECH SPECIALTY CABLES (Pty) Ltd

Butterfly-shaped fiber optic cable connection



Overview

Butterfly -shaped optical fiber optical cableThey are called butterfly-shaped due to their unique design, which features a flat shape with Four -end connec.

Key Takeaways

Butterfly-shaped fiber optic cables, also known as ribbon or flat optical cables, are connected using fusion splicing, ribbon splicing, connectorization, or pre-terminated solutions, offering high flexibility and low signal loss.Structure and Design

Butterfly-shaped fiber optic cables feature a flat, wing-like profile with optical fibers running in the center and parallel strength members on either side, often made of Fiber Reinforced Plastic (FRP) or steel for outdoor self-supporting variants . This design allows minimal stress when bent in the flat plane, making installation along walls, conduits, or tight spaces easier . Indoor versions are lightweight, flexible, and typically carry 1–12 fiber cores, while outdoor self-supporting types include a steel messenger wire for aerial deployment .

Connection Methods
• Fusion Splicing: Individual fibers are aligned and fused using an electric arc or laser, creating a permanent, low-loss connection. This method is highly reliable but requires specialized equipment and trained technicians .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Ribbon Splicing: Entire ribbons of fibers are fused simultaneously, which is efficient for high-density applications like data centers. It reduces installation time when connecting multiple fibers at once .

• Connectorization: Connectors are attached to individual fibers, allowing them to plug into patch panels or optical devices. This method is simpler and cost-effective but introduces slightly higher signal loss compared to splicing .

• Pre-Terminated Solutions: Cables come with factory-installed connectors, enabling quick deployment without field splicing, ideal for rapid installations in FTTx networks or data centers .
Advantages
• Low Signal Loss: Maintains high-quality data transmission .

• Flexibility: Flat design allows easy routing in confined spaces .

• Durability: Resistant to wear and tear, suitable for indoor and outdoor environments .

• Interference Resistance: Non-metallic strength members prevent electromagnetic interference .

• Space Efficiency: Compact structure is ideal for high-density installations .
Applications

Butterfly-shaped cables are widely used in FTTH (Fiber-to-the-Home), FTTx networks, and data centers, where high bandwidth, minimal signal loss, and flexible routing are critical . Indoor variants are optimized for building entry points and subscriber connections, while outdoor self-supporting types span aerial distances up to 50 meters without additional support . In summary, butterfly-shaped fiber optic cables combine efficient connectivity, flexibility, and durability, with multiple connection methods tailored to installation requirements, making them ideal for modern high-speed optical networks.
