Can a generator be connected to two distribution boxes

Overview

A single generator can support two transfer switches, distributing power to different circuits separately. This setup is useful for homes with essential and non-essential loads or businesses that need prioritized power distribution. In critical or life-safety applications, having multiple generators connected to the bus at all times increases the likelihood of continuou ad demand, ensuring that each generator is efficiently loaded. But how does it work?

And what should you consider. Client has two buildings, 120/240 service (one 200A, one 400A), each with a separate meter, fed from the same on-premise pad pig, building grounds bonded at the main breaker service panels in each building. This setup allows users to power different circuits or buildings from one generator, providing flexibility during power outages or emergency. Paralleling two or more generators offers several practical benefits over a single-generator system. Is there a way to feed both panels at once ?

I would be using an interlock. By clicking “Post Your Answer”, you agree to our terms of service and acknowledge you have read our privacy.
