Can another switch be connected below a PoE switch

Overview

Can you use a POE switch with another POE switch?

Modern poe switches can detect the type of connections they get. Older versions weren't as smart and coul.

Key Takeaways

Yes, you can connect another switch below a PoE switch, but the downstream switch typically requires its own power source unless it is specifically designed for PoE input.Connecting Two Switches

You can daisy-chain switches by connecting one switch's uplink port to a standard port on the other switch using an Ethernet cable. Modern switches often have auto-MDI/MDI-X capability, which automatically detects the cable type, simplifying the connection process . This setup allows the downstream switch to communicate with the main network and extend connectivity to additional devices.

Power Considerations

While PoE switches provide both data and power to connected devices, most standard PoE switches cannot be powered by another PoE switch due to power limitations . The total power draw of a downstream switch and its connected devices would exceed what a typical PoE port can supply. Some specialized PoE-powered switches, like the UniFi Switch Flex Mini, can receive power via PoE, but these are exceptions and usually have limited power budgets .

PoE and Non-PoE Devices

A PoE switch can be connected to a non-PoE switch without issues, but PoE will not pass through the non-PoE switch. Only devices directly connected to the PoE switch will receive power . If you need to power devices downstream, you must either use a PoE injector or ensure the downstream switch is PoE-capable and powered appropriately.

Practical Tips
• Use the uplink port on the main switch for the connection to the secondary switch to optimize performance .

• Check the PoE standard (802.3af, 802.3at, or 802.3bt) to ensure compatibility with connected devices .

• Monitor the total power budget of the PoE switch to avoid overloading ports.

• For large networks, consider managed switches to enable VLANs, QoS, and better traffic control . In summary, connecting another switch below a PoE switch is common and feasible for expanding network coverage. However, the downstream switch usually requires its own power unless it is specifically designed to accept PoE input, and PoE will not pass through non-PoE switches. Proper planning of power budgets and port usage ensures reliable network performance.
