Cause of fire in construction site electrical distribution box

Overview

According to HSE electrical safety guidance, electrical fires are commonly caused by faulty wiring, overloading, poor insulation, inadequate maintenance, and misuse of electrical equipment. Electrical fires rarely start with flames. They usually begin silently inside walls, switchboards, cables, and equipment, long before anyone smells smoke or sees sparks. By the time flames appear, temperatures may already be high enough to cause flash ignition and rapid fire spread. Electrical distribution and lighting equipment are two of the leading causes of fires in structures undergoing a major renovation. Fires in structures under construction are responsible for an average of four civilian deaths, 49. Fires in structures under construction, whether newly built or undergoing renovation, can result in major financial losses and pose serious risks to the lives of workers, firefighters, and residents. Several reputable sources, including the National Fire Protection Association (NFPA) and National. The combination of ignition and fuel sources on construction sites make them very high-risk areas for fire breakouts. Not only can this cause major damage to materials on site and delays to project deadlines, but it can pose a serious threat to life.
