Does the PE wire of the distribution box need to be grounded

Overview

A wire type equipment grounding conductor of a circuit passing through the box is not required to be connected to the box.

Key Takeaways

Yes, a distribution box must be grounded if it has a PE wire to ensure safety and compliance with electrical standards.

Importance of Grounding

Grounding a distribution box provides a safe path for fault currents, preventing electric shock to personnel and protecting equipment from damage . The PE wire ensures that any leakage or accidental contact with live parts does not pass through a person, but instead flows directly to the ground . Without proper grounding, touching the box during a fault could result in serious injury or electrocution .

Proper Connection Method
• Locate the PE Bar: Open the distribution box and identify the grounding bar or PE terminal, which is the designated connection point for the PE wire .

• Connect the PE Wire: Use a yellow-green insulated copper wire of appropriate cross-section (as specified by local standards) and connect it firmly to the PE bar. Ensure the connection is tight and secure to maintain low resistance .

• Ground Electrical Components: Any internal components that require grounding should also be connected to the PE bar to ensure safe operation .

• Verify Grounding: The resistance between the distribution box and the main grounding point should be low (typically
