ZITHA TECH SPECIALTY CABLES (Pty) Ltd

Fiber optic splicing for 144 core optical fibers in optical distribution box

Overview

144 Cores IP68 Fiber Optical Dome Splice Closure, 2 Inlet 8 Outlet. In summary, this product is a fundamental building block for managing and protecting.

Key Takeaways

144-core fiber optic splicing is typically performed in high-capacity splice closures with multiple trays, providing organized, protected, and re-enterable environments for fusion splicing and fiber management.Choosing the Right Splice Closure

For 144-core fibers, dome or vertical splice closures are commonly used. These closures are designed to handle high-density splicing while maintaining environmental protection (IP68) for outdoor applications . Key features include:

• Multiple splice trays: Typically 6 trays with 24 splices per tray, allowing structured routing and easy re-entry .

• Port configuration: Closures may have multiple inlet/outlet ports (e.g., 1-in/10-out or 4 ports) to support straight-through and branching connections .

• Material and sealing: Made from durable plastics (PC, PP, or MPP) with silicone or heat-shrink sealing to ensure long-term protection against moisture and dust .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Re-entry capability: Mechanical or heat-shrink seals allow technicians to open the closure for maintenance or network expansion without compromising IP68 protection .

Splicing and Fiber Management

• Fusion splicing is the primary method for connecting fibers inside the closure. Each splice is protected in a splice sleeve within the tray .

• Slack management: Excess fiber is coiled neatly in the trays to allow future re-splicing or network modifications .

• Tray organization: Fibers are routed in trays to prevent bending below the minimum bend radius, ensuring signal integrity .

• Branching and pass-through: Some fibers can be spliced to local drops while others pass through to the next node, supporting flexible network design .

Installation Considerations

• Mounting options: Closures can be installed aerially, on walls, poles, or direct-buried in ducts or manholes .

• Cable compatibility: Ensure the closure ports match the cable outer diameter (commonly 7–24 mm) and that sheath retention and central strength member fasteners are used for stability .

• Environmental protection: Proper sealing at entry ports with heat-shrink or mechanical seals is critical for maintaining IP68 rating .

• Documentation and labeling: Maintain consistent port and tray labeling to simplify future maintenance and network expansion .

Summary

Using a 144-core splice closure with multiple trays allows efficient fusion splicing, organized fiber routing, and secure environmental protection. Dome or vertical closures with re-entry capability are ideal for high-density FTTH or telecom networks, supporting branching, pass-through, and flexible installation in aerial, wall-mounted, or direct-buried applications . Proper tray management, slack handling, and sealing ensure long-term reliability and ease of maintenance.
