ZITHA TECH SPECIALTY CABLES (Pty) Ltd

Ireland High Voltage Cable Tray Construction

Overview

The cable that will be used is high-voltage XLPE cable with copper or aluminium core, installed within underground plastic ducts.

Key Takeaways

High voltage cable trays in Ireland are typically manufactured to I.S. EN 61537:2007 standards, using hot-dip galvanized steel or stainless steel, with classifications for light, medium, and heavy duty applications.Standards and Compliance

High voltage cable trays in Ireland must comply with I.S. EN 61537:2007, which governs cable tray systems and their accessories for electrical installations . Compliance ensures mechanical strength, electrical continuity, and safety under normal operating conditions. CE marking is required as proof of conformity with European directives, and products may also be certified by third-party organizations for quality and safety .

Material Specifications
• Steel: Low carbon steel sheets, continuously hot-dip zinc coated (EN 10327 Grade DX5 1D Z275) for corrosion resistance .

• Stainless Steel: AISI 316L grade is used for environments with high corrosion risk, enhanced with chromium and molybdenum for durability .

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Aluminum: Selected alloys provide high corrosion resistance and a favorable strength-to-weight ratio, suitable for outdoor or industrial environments .

Load Classifications

Cable trays are classified based on mechanical load capacity:

• Light Duty: Suitable for small instrumentation or control cables.

• Medium Duty: For standard power and communication cables.

• Heavy Duty: Designed for high voltage or large cable bundles, ensuring structural integrity over long spans .

Design and Installation

• Interconnection: Trays are joined using locking screws and serrated nuts, tightened to specified torque values to maintain electrical continuity .

• Span and Support: Maximum span depends on load classification; installers must ensure adequate support to prevent sagging or mechanical failure .

• Ventilation and Covers: Ventilated trays allow heat dissipation, while solid covers protect against dust, moisture, and electromagnetic interference .

• Bend Radius: Minimum bend radius must be maintained to prevent cable damage, typically 6–9 inches (150–230 mm) between rungs for ladder-type trays .

Environmental Considerations

• Indoor Use: Standard galvanized steel trays are sufficient.

• Outdoor or Corrosive Environments: Stainless steel or aluminum trays are recommended to resist corrosion and maintain mechanical performance .

• Fire and Overheating: Trays must not be subjected to voltages, currents, or temperatures beyond their rated specifications to prevent fire hazards .

Summary

For high voltage installations in Ireland, cable trays should be selected based on load requirements, material suitability, compliance with I.S. EN 61537:2007, and environmental conditions. Proper installation, including torque specifications, support spacing, and bend radius, is critical to ensure safety, reliability, and longevity of the cable management system .
