New devices are being connected to the switch but existing devices cannot connect

Overview

If you have device A connected to device B over a Gigabit link, and the link does not come up, perform this procedure. Step-by-Step Procedure Verify device A and B use the same GBIC, short wavelength (SX), long wavelength (LX), long haul (LH), extended wavelength. What troubleshooting measures can help when device discovery fails after adding a new switch to the network?

When device discovery fails after adding a new switch to the network, use the following focused troubleshooting measures: 1. Physical Layer Checks Cabling: Verify all cables are properly. If you have physical access to the switch, it can save time to look at the port LEDs which give you the link status or can indicate an error condition (if red or orange). The table describes the LED status indicators for Ethernet modules or fixed-configuration switches: Ensure that both sides have. On multiple switches in our network, we are not able to successfully connect through ethernet. It simply says “Identifying. No internet”. This only happens to newly connected devices. The. Let's talk about the essential part of troubleshooting VLAN and switch problems. Later, in part two I'll look further into a “No. This article will list a few simple steps about how to do a check on the switch when the switch has no Internet access and try to solve the problem. Here we will list some common factors in this article. Check your device's LED or LCD screen.
