Optimization Scheme for Core Switches

Overview

High-speed system architecture design of DCN core switchThe architecture design of the new generation 51.2T core switch high-speed system is based on 112G.

Key Takeaways

Optimizing core switches involves balancing high-speed architecture, SFP uplink deployment, energy efficiency, and cost-effectiveness to achieve scalable, reliable, and high-throughput network performance.High-Speed Architecture Optimization

Modern core switches, especially in large-scale data centers, require high-speed system architectures to handle massive data throughput. Techniques include eliminating PHY C2M links on daughter boards, integrating single-chip high-capacity switches (e.g., 25.6T to 102.4T), and ensuring signal integrity through careful PCB and interconnect design. High-speed optimization focuses on minimizing latency, maintaining signal integrity at multi-gigahertz frequencies, and supporting future port rate growth from 10G to 1.6T Ethernet standards .

SFP Uplink Deployment

SFP uplinks are modular high-speed interfaces that connect core switches to other network devices over fiber or copper. Optimizing SFP uplinks involves:

• Selecting appropriate short-reach DACs or long-distance fiber based on topology to reduce unnecessary costs.

• Ensuring scalability by decoupling switch hardware from physical media, allowing phased network expansion.

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Considering operational costs, including power consumption, cooling, and maintenance, which can exceed initial procurement costs if not managed .
Energy and Efficiency Optimization

Core switches consume significant power, especially with multiple high-speed transceivers. Optimization strategies include:

• Implementing variable switching frequency schemes in power supplies to reduce combined switching and inductor core losses, achieving up to 27% energy savings without hardware changes .

• Using temperature-compensated multi-objective frameworks to minimize core losses while maximizing magnetic energy transmission in power components, ensuring thermal stability and efficiency .
Multi-Objective and Lifecycle Considerations

Effective optimization requires multi-objective approaches that balance throughput, energy efficiency, and cost. Techniques include:

• Pareto-optimal solutions for core loss and energy transmission.

• Lifecycle cost analysis, considering long-term maintenance, failure rates, and energy consumption.

• Decision-making strategies such as utility functions or hybrid algorithms to refine trade-offs between performance and operational costs .
Practical Recommendations
• Design for scalability: Use modular SFP uplinks and high-capacity switching chips to accommodate traffic growth.

• Optimize power efficiency: Apply variable frequency schemes and thermal-aware core loss models in switch power supplies.

• Ensure signal integrity: Conduct high-speed PCB and interconnect analysis to prevent data errors at multi-gigabit rates.

• Balance cost and performance: Evaluate both initial deployment and operational costs, including energy and maintenance, to minimize total cost of ownership. By integrating these strategies, enterprises can achieve high-performance, energy-efficient, and cost-effective core switch deployments suitable for modern data center and enterprise networks.

Article Content

High-speed system architecture design of DCN core switch

The architecture design of the new generation 51.2T core switch high-speed system is based on 112G SERDES, and one of or some

A new architecture for high speed core-selective switch for multicore ...

In this work, we develop a new architecture to build a high-speed core-selective switch, which is critical for efficiently

(PDF) A Novel Switch Architecture for Multi-Die Optimization with ...

With limited inter-die connections in mind, we propose a scalable, unified switch architecture optimized for efficient

A Novel Switch Architecture for Multi-Die Optimization with ...

The advent of multi-die chiplet packaging as a prevailing trend in complex chip development presents challenges in

Core Switch

The core switches are connected to every switch in the aggregation layer, enabling multipath traffic flow optimization. An example of

A Novel Switch Architecture for Multi-Die Optimization with

Abstract: Switches play a critical role as core components in data center networks. The advent of multi-die chiplet packaging as a

Optimization of Switch Allocation Problems in Power Distribution

This paper presents the implementation of the mono-objective Switch Allocation Problem (SAP) optimization model

SFP Uplinks for Core Switches Cost Optimization Guide

This guide explores the most important technical and financial considerations for SFP uplinks in core switches, helping enterprises

Bi-Level Coordinated Planning of Sectionalizing Switches ...

In order to improve the reliability of power supply and achieve economic distribution network operation, this paper

Future Data Centers Core Switches Design Challenges

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

This article surveys recent work in optical switching technologies and presents a fast optical circuit switch that

Performance analysis and hardware implementation of a nearly

This paper investigates a simple but efficient buffer management scheme for high-performance shared-memory

FS Community
