There are 2 main laying types for overhead fiber optic cables, hanging under steel strands and self-supporting. Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Fiber in a duct solutions have a major aesthetic. In the communications industry, how to construct overhead optical cable is a problem that many front-line communications construction workers will encounter. If we can reduce failures and increase the service life of optical cables by carrying out communication optical cable construction in a. There are three common laying methods for outdoor optical cables, namely: underground pipeline laying (that is, laying optical cables in underground pipelines), direct underground laying and overhead laying (that is, laying from utility poles to utility poles in the air. Depending on engineering. When implementing broadband projects, different methods are used to lay the fibre optic cables. In contrast to “classic” civil engineering, in which an open trench is dug and the pipes are laid at least one meter deep, alternative laying techniques require less depth – and ideally almost no large. The objective of this document is to be an optical fibre cable installation and laying guide, addressed to new installers, also being useful as a reminder to experienced installers. Essentially, deployment can be either through the stationary or moving reel placing method – but before deciding on which is best for the particular project, follow this checklist: Carry out a full route survey, and make sure that representatives of each organisation potentially affected by the.
