# The optical power meter module cannot detect light

## Overview

The optical module is faulty. Ever stared at your setup in the lab, scratching your head because that stubborn photodiode just won't pick up any light?

Yeah, I've been there more times than I can count. As someone who's tinkered with these things for over a decade at BeePhoton, fixing photodiode troubleshooting nightmares for. Common optical module faults include optical port contamination,ESD damage,abnormal optical power (overload or insufficiency),and compatibility conflicts. A general description is followed by explanations of how to operate the unit manually. You will also find information about a simple remote control of the. The first step is to check whether the rate and duplex mode of the ports at both ends match - execute the "show interface brief" command to check, and if they do not match, configure the rate and duplex mode of the ports through the speed command and duplex command. Step 2. EXFO can help save both time and costs with an automated calibration test system that is designed for the verification of power meters, attenuators, sources and optical time-domain reflectometers (OTDRs).
