The terminal box includes a pigtail fiber

Overview

The optical fiber terminal box is the terminal joint of an optical cable, one end of which is an optical cable, and the other end is a pigtail, which is equivalent to a device that splits an optical cable into a single optical fiber. Without pigtails, every termination in an ODF, terminal box, or splice closure would require field-installed connectors—an approach that is both time-consuming and less reliable. For procurement managers and engineers, understanding fiber pigtails is not only about knowing another product type, but. This box is used as a termination point for the feeder cable to connect with drop cable in FTTx communication network system. Meanwhile, it provides solid protection and management for the FTTx network.
