What is Category 4 single-mode fiber

Overview

Fiber Optic Cable Types Explained OS1 single mode fiber optic cables are made with a single mode fiber core, which means that they have a Fiber Optic Cable.

Key Takeaways

Category 4 Single-mode Fiber corresponds to high-performance single-mode fiber, typically represented by OS2, designed for long-distance, high-speed optical transmission.Overview

Single-mode fiber (SMF) is characterized by a small core diameter of approximately 9 microns, allowing only one light path to propagate. This design minimizes signal dispersion and enables long-distance, high-bandwidth transmission suitable for telecom, FTTH, campus backbones, and data center interconnects . The two main single-mode fiber categories are:

• OS1: Standard indoor single-mode fiber, suitable for short-distance runs within buildings. It has a maximum attenuation of 0.4 dB/km at 1310 nm and 0.3 dB/km at 1550 nm, supporting distances up to 10 km at 10 Gbps .

• OS2: Advanced single-mode fiber optimized for long-distance and outdoor applications, including campus and backbone networks. OS2 features low water-peak attenuation, improved durability, and supports distances up to 40 km at 10 Gbps or more depending on transceivers and link design .
Technical Characteristics
• Core Diameter: ~9 µm

• Cladding Diameter: 125 µm

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Attenuation: OS2 typically ≤0.4 dB/km at 1310 nm and ≤0.3 dB/km at 1550 nm

• Bandwidth: Supports high-speed transmission (10 Gbps, 40 Gbps, and beyond)

• Construction: Tightly buffered with dual-layer protective coating; OS2 is often gel-free for outdoor use

Applications

Category 4 single-mode fiber (OS2) is ideal for:

• Long-haul telecom networks

• Campus backbone connections

• FTTH (Fiber to the Home) deployments

• Data center interconnects requiring high-speed, long-distance links

• Outdoor and aerial installations due to enhanced environmental resistance

Comparison with Multimode Fiber

Unlike multimode fibers (OM1-OM5) with larger cores (50–62.5 µm) that support multiple light paths for short-distance links, single-mode fibers like OS2 provide longer reach and higher bandwidth. Multimode fibers are typically used in data centers for 10G/40G/100G short-range connections, whereas OS2 is preferred for backbone and long-distance applications .

Key Considerations

• Always verify the optical transceiver compatibility and link loss budget before deployment.

• OS2 is backward compatible with OS1 in most cases, but OS2 is recommended for modern, long-distance networks.

• Environmental factors, splicing, and connector quality can affect actual transmission distance . In summary, Category 4 Single-mode Fiber (OS2) is a high-performance, long-distance fiber solution optimized for modern telecom, campus, and data center networks, offering low attenuation, high bandwidth, and reliable long-range transmission.
