What is the core switch processor

Overview

At the heart of the Nintendo Switch lies a custom CPU developed by NVIDIA, based on its Tegra chip architecture. This combination enabled balanced performance. We found it to be very well-suited for a mobile console. However, if you peel back a layer, there are four ARM CPU cores inside — specifically Cortex A57 cores, which take up about two square millimeters of space on the die. A core switch is a high-capacity, high-performance Layer 3 switch positioned at the physical backbone of an enterprise network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. The Nintendo Switch uses a custom ARM-based processor from Nvidia. Do all Nintendo switches have the same processor?

Both the Switch and Switch Lite perform very.
