What is the temperature resistance of the optical module

Overview

Commercial grade optical modules are 0℃～70℃, the extended grade is -20℃～+85℃, industrial grade optical modules are -40℃～85℃, the same as can support working temperature. Different testing methodsOptical fiber's ability to withstand extreme heat and cold directly impacts signal integrity, network reliability, and maintenance costs, especially in harsh environments like industrial facilities, outdoor installations, and data centers. This comprehensive guide answers the question: “How much. As pluggable modules scale to 400G and beyond, thermal management becomes a primary reliability constraint. This article explains contemporary thermal strategies for OSFP modules — from fin geometry tuning to detachable heatsink covers — and maps measured performance to practical deployment steps. High-speed optical modules generate significant heat. Studies show that for every 10°C rise in temperature, the lifespan of sensitive components like laser diodes can be halved. E-Temp ranges from -20℃ to +85℃. In addition, industrial optical. Two common ratings that will condition the thermal design of optical transceivers are commercial (C-temp) and industrial (I-temp) ratings.
