What size cable tray should be used for 316 cable

Overview

Best Size: Here, deep trays (75mm to 150mm) are used since power cables are typically thick and heavy. Data cables, such as your Wi-Fi or computer ones, are extremely sensitive. They do not get hot; however, they do not like to hang or sag. Cable tray sizing looks simple on paper, but in real projects it affects cable safety, thermal performance, maintainability, future expansion, and inspection approval. In EPC and industrial automation projects, a tray that is undersized forces last-minute redesigns, cable overcrowding, poor heat. Properly sizing your cable tray is critical for safety and compliance. Follow these simple steps: Define Tray Dimensions: Enter the width and depth of your planned cable tray (in mm or inches). With excellent resistance to corrosive oils, gases and chemicals stainless steel cable tray is preferred for. When choosing the size of cable tray, it is a tradeoff between the existing volume of cable and the future volume of cable. It is grounded on 40 years of experience in the manufacturing.
