What turn signal is used when a cable tray is turning

Overview

Cable Tray Manual PDF | PDF | Electrical Wiring | CableCable Tray Manual.pdf - Free download as PDF File (.pdf), Text File (.txt) or read online for free.

Key Takeaways

A cable tray uses an "elbow" fitting for a single horizontal 90° turn.Elbow Fittings

When a cable tray changes direction, the section that facilitates the turn is called an elbow. Elbows are designed to guide cables smoothly around corners while maintaining the minimum bend radius required for the cables, preventing damage and ensuring proper cable performance ( ). They are available in various angles, commonly 45° and 90°, and can be horizontal or vertical depending on the layout.

Other Turn Components
• Tee (T) fittings: Used when a cable tray branches off from a main run into two directions at 90° ( ).

• Wye fittings: Allow branching in multiple directions with smoother transitions, often used for splitting a tray into two paths.

• Cross fittings: Used when a tray branches in four directions ( ).
Installation Considerations
• Maintain the minimum bend radius for cables to avoid stress or insulation damage ( ).

© 2026 ZITHA TECH SPECIALTY CABLES (Pty) Ltd - All rights reserved

• Ensure proper support and securement at the elbow to prevent sagging or cable strain ( ).

• For solid cover trays, use compatible covers or clamps to maintain protection over the turn ( ).

• Horizontal and vertical elbows should be selected based on the tray type (ladder, trough, or ventilated) and the environment.
Summary

For a cable tray making a turn, the elbow fitting is the standard "turn signal" used to guide cables safely around corners. For branching or multiple directions, tees, wyes, or cross fittings are used depending on the layout and design requirements ( ). Proper selection ensures cable integrity, compliance with NEC standards, and ease of maintenance.
