What wires are run in a power cable tray

Overview

Power limited tray cables can be routed in the same tray as 600V power and control tray cables when separated by a divider.

Key Takeaways

Power cable trays typically carry power, control, and instrumentation cables, including TC, TC-ER, and ITC types, designed for safe, organized, and code-compliant installations.Types of Cables in Cable Trays

1. Tray Cable (TC) Tray Cable (TC) is a multi-conductor cable rated for 600 volts, commonly used for power and control circuits in industrial and commercial settings. It consists of two or more insulated conductors under a non-metallic jacket and may include bare or covered grounding conductors. TC cables are UL listed and suitable for installation in cable trays, raceways, and outdoor locations when supported by a messenger wire. They are flame-retardant and can be used in hazardous locations if properly rated . 2. Tray Cable with Exposed Run Rating (TC-ER) TC-ER cables are designed for exposed runs outside the tray for short distances (up to six feet) while maintaining mechanical protection. They meet crush and impact requirements and are often used to connect the tray to equipment or devices without continuous support . 3. Instrumentation Tray Cable (ITC) ITC cables are used for instrumentation and control signals, available in shielded or unshielded constructions. They typically have a 300-volt insulation rating and come in sizes from 22 AWG to 12 AWG. ITC cables are suitable for Class 2 and Class 3 circuits and may include twisted pairs or metal armor for additional protection .

Installation Considerations
• Separation of Cables: Power cables should be separated from sensitive data or signal cables to prevent interference. Dividers or separate trays are often used for this purpose .

• Fill Ratio: Cable trays have maximum fill limits to avoid overheating and maintain accessibility for maintenance .

• Ampacity Derating: Bundled cables in trays experience mutual heating, which reduces their current-carrying capacity. Proper spacing and ventilation are essential to maintain ampacity .

• Tray Types: Ladder trays are preferred for power cables due to excellent ventilation, while solid-bottom trays provide protection from debris but require stricter fill limits .
Summary

In a power cable tray, you will typically find power cables (TC, TC-ER), control cables, and instrumentation cables (ITC). These cables are selected based on voltage rating, environmental exposure, and NEC compliance. Proper installation includes maintaining separation, respecting fill limits, and considering ampacity derating to ensure safety and performance.
